

CHAPTER – 01

INTRODUCTION

1.1 – Project Overview

The food service industry has undergone significant transformation with the rise of online food delivery platforms, changing consumer lifestyles, and increased digital adoption. Consumers today prioritize convenience, variety, affordability, and quick service when ordering food. Understanding these changing preferences is essential for restaurants, food delivery companies, and marketers to develop effective customer-centric strategies.

This project aims to analyze consumer food ordering behaviour and identify key trends influencing purchasing decisions. The study focuses on understanding how often consumers order food, their preferred platforms and cuisines, spending patterns, and the factors that drive their choices. Particular attention is given to the role of discounts, delivery speed, food quality, customer reviews, and digital payment options in shaping ordering habits.

The research follows a descriptive and analytical approach using primary data collected through surveys and questionnaires, supported by secondary data from industry reports and academic sources. The target respondents include students, working professionals, and other regular food consumers. Data collected will be analyzed to identify patterns, preferences, and emerging consumer trends.

Food Ordering Behaviour and Consumer Trends: A Structured Analysis of Choices and Habits

Key variables examined in the study include demographic characteristics (age, gender, occupation, and income), behavioural factors (frequency of ordering, average expenditure, preferred cuisines, and ordering time), and satisfaction indicators (delivery experience, packaging quality, value for money, and overall service satisfaction).

The expected outcome of the project is to provide meaningful insights into modern food ordering habits and the factors influencing consumer decisions. The findings will help food delivery platforms and restaurants improve service quality, customer engagement, promotional strategies, and overall user experience. Additionally, the study will contribute to understanding the evolving dynamics of consumer behaviour in the rapidly growing digital food delivery market.

Overall, this project seeks to offer a structured analysis of food ordering choices and habits, enabling businesses to adapt to changing consumer expectations and enhance customer satisfaction and loyalty.
